LETTER
2024

Hyperdrive your Investments (Retirement Account) to Enjoy Earlier

This newsletter is supplied to provide you with technical data on movement for some notable Standard and Poor's S&P 500 stocks. I have added some stocks that are relevant for millennials and meme stocks. This newsletter focuses on Technical Analysis (is used more in the review of short-term investments decisions) and no Fundamental Analysis (is most often used when determining the quality of long-term investments).

It has always been said that you should never try to time the Stock Market, but I am here to say you can do it with some level of certainty. You can never achieve 100% certainty in any decision model, but I provide you with an algorithm model with color trends to help you make optimized manual buy and sell decisions. The main purpose of the charts: (1) direct you to make purchases near the Price Curve lows see Buy Range columns "Green" and (2) sell stocks after a triple digit Year to Date (YTD) run up at the presence of trending color change from "Blue" to "Pink".

Below is a typical price curve with the color trends and rebound percentages. This graphical picture should help you visualize the condensed material in the charts. The data generated for stock and mutual funds charts are captured from the closing price on Friday's and crypto currencies data is captured on Friday's at 7 pm.

The chart below is an informative combination of YTD stock movement, and color indicators to show how the price is trending. A stock will trend "Green" after reaching a threshold value for Rebound Factor (RF) % and may trend "Green" for weeks. To minimize purchasing too early in the trending "Green" it is suggested to be patient and wait for the stock to rebound above dip floor before purchased.

| Weekly Newsletters | YTD N-3 | YTD N-2 | YTD N-1 | YTD N | Now Price | Buy Low Price | Buy High Price | Trending Green (wks) | Dip Floor Price | Rebound Factor (RF) % | Now Factor (NF) % | Bounce Factor (BF) % |
|--------------------|---------|---------|---------|-------|-----------|---------------|----------------|----------------------|-----------------|-----------------------|-------------------|----------------------|
| Week 1 | 95% | 100% | 110% | 90% | 76.00 | 41.88 | 48.16 | N/A | 40.00 | 110% | 11% | 90% |

 XX% Rebound % back to recent high price

Notice that as the price gets closer to the bottom of the dip, the YTD N color repeats being “Yellow” until the bottom is reached and a “White” font appears YTD N-1 to signify the Now Price is on an upswing. I do not tell you when to buy or sell, but you have all the information to make an informed choice amid an unknown future.

The Legion Chart on the previous page should be the most informative tool an active trader has ever had. The condensed format of taking stock curve price data and converting it into YTD Analysis should be a real breakthrough. This process suggests making stock market decisions before the stock market opens and removes the need to monitor the stock market during the day. Remember we are supposed to be working our 9 to 5 job while the stock market is doing its thing growing our investment dollars. Yes, I am providing this useful information tool for free. Below is the explanation of all the columns from left to right.

1. YTD N-2 - this is the Year to Date growth of a stock two weeks in the past.
2. YTD N-1 - this is the Year to Date growth of a stock one week in the past.
3. YTD N - this is the Year to Date growth of a stock right now the week of the published Newsletter.
4. Now Price - is the now price of the stock the week of the published Newsletter.
5. Buy Low Price - this is a fixed price above the Dip Floor Price to allow for price float and minimize false buy triggers. When the Stock Price is above the Buy Low Price and below the Buy High Price, both cells will be “Green” to signify it is a good time to consider making a purchase. You can enter either Low or High Price in your brokerage account as a limit order.
6. Buy High Price - this is a fixed price above the Dip Floor Price to allow for price float above the Buy Low Price. The float provided is a default for all stocks, but the float is increased for stocks that have a Spike Ratio of 2.0. When the Stock Price is above the Buy Low Price and below the Buy High Price. These cells will be “Green” to signify it is a good time to consider making a purchase. You can enter this cell value in your brokerage account for a limit order.
7. Trending Green (wks) - This provides you with the number of weeks a particular stock has been between the Buy Price ranges. The float provided is a default for all stocks, but the float is increased for stocks that have a Spike Ratio of 2.0. This small Buy Now range could be jumped over because of the data being measured is once every 7-days. Yes, the cell could have N/A in it and not catch anything. This active trader tool is suggestive and is not intended to be an absolute tool. For this reason, you should consider entering the Buy High or Low Price as a Limit Orders in your Brokerage Account.
8. Spike Ratio – this is an indicator of stocks with a hyperbolic gain that typically has an associate quick drop off. If you own a stock that grows to a Spike Ratio of 2, I suggest you sell near the high and take your quick gain. I would suggest that you not purchase the dip of a stock with a Spike Ratio of 2 because a repeat growth back to the previous high is not based on performance but popularity and speculation.
9. Dip Floor Price - the price provided will be one of two prices. One is the lowest price in the range of measured prices. The second is a dip price below the 52-Week High. The second dip price is typically something that can't be measured or suggested by traditional trading tools.
10. Rebound Factor (RF) % - this is exactly what you think it is. This is the ratio of maximum past (June of previous year) to present price divided by the measured range divided by the lowest past (December 31st of previous year) to present price which is called the RF. The RF is then converted to a percentage. This value is always positive.
11. Now Factor (NF) % - This is the positive replacement for the 52-Week Change%. Who cares how much the price has dropped from the high price. This is the wrong thing to measure. This is the ratio of maximum past (June of previous year) to present price divided by the Now Stock Price which is called the NF. The NF is then converted to a percentage. The real thing to measure is the growing Exponential Rebound as the price drops further and further. If a stock has a 52-Week Change% of -50% or -75%, the corresponding Now Potential Rebound 100% or 300%, respectively. You say to yourself, wow. The Now Potential Rebound of 100% or 300% would be a multiple of 2 or 4. If you invested \$32,000 and achieved a multiple of 2 or 4 your investment dollars would be \$64,000 or 128,000, respectively. The growth of the security has a 1 to 1 relationship with total investment made in a company.
12. Bounce Factor (BF) % - the percentage provided can be Zero for two situations. One is when price is at the absolute lowest price for the price range. The second is when price sets lower or a new lower prices. The default calculated percentage when not Zero is the ratio of the Now Stock Price divided by Dip Floor Price which is called the BF. The BF is then converted to a percentage.

Big Bank Boss Triple Point Reference Frame

The discrete measurements of 52-Week High Change % and 52-Week Low Change % are at best an apples and oranges comparison and not entirely useful. For this exact reason, I created the Big Bank Boss Triple equations. The Big Bank Boss Triple equations output are positive numbers. The ratios can easily be converted to percentages. Now you have an apple-to-apple comparison with real-time growth potential. The output results define the now stock price in a triple reference box of the Rebound Factor (RF), Now Factor (NF) and Bounce Factor (BF).

These formulas are very useful whenever the Stock Market goes thru a crisis or market correction. The Bounce Factor (BF) is identical to the 52-Week Low Change which represents the percentage above the Dip Floor Price. The Rebound Factor (RF) defines the maximum potential range for a stock based on past performance. The values of NF and BF in themselves do not provide a holistic picture. It is very important to add in the crucial component of trending upward or downward. If the trend of the price is downward the NF increases and the BF decreases.

There is no way to predict when future stock prices will trend upward, but I provide a weekly Big Bank Boss Newsletter that shows the weekly price trend charts with a "Yellow" cell to indicate a new low indicator and a "White" font cell to indicate a trending up from the Dip Floor Price.

H 5.24 Figure 1. Big Bank Boss Triple Point for RIG as of Jan. 29, 2021

Big Bank Boss Triple Point Equations

These three equations are always positive and make it easy to convert to percentages. Also, a unique thing about these ratios is an equation can be formed to solve for one unknown. This equation can be the building block for a program to monitor stock price movement. The 52-Week Range for RIG is converted below.

$$\begin{aligned} \text{Rebound Factor (RF)} &= (52 - \text{Week High}) / (52 - \text{Week Low}) \\ &= (5.24 / 0.65) = 8.06 \end{aligned}$$

$$\begin{aligned} (\text{RF}) \% &= ((\text{RF}) - 1) \times 100 \\ &= ((8.06) - 1) \times 100 = 706\% \end{aligned}$$

$$\begin{aligned} \text{Now Factor (NF)} &= (52 - \text{Week High}) / (\text{Now Price}) \\ &= (5.24 / 3.36) = 1.56 \end{aligned}$$

$$\begin{aligned} (\text{NF}) \% &= ((\text{NF}) - 1) \times 100 \\ &= ((1.56) - 1) \times 100 = 56\% \end{aligned}$$

$$\begin{aligned} \text{Bounce Factor (BF)} &= (\text{Now Price}) / (52 - \text{Week Low}) \\ &= (3.36 / 0.65) = 5.17 \end{aligned}$$

$$\begin{aligned} (\text{BF}) \% &= ((\text{BF}) - 1) \times 100 \\ &= ((5.17) - 1) \times 100 = 417\% \end{aligned}$$

The three Big Bank Boss Triple Point equations are linked in the single equation shown below. This equation only works for values are ratios, so you can't use this formula when the values are percentages.

$$NF = RF / BF$$

Substitution:

$$RF = 8.06 \text{ and } BF = 5.17$$

$$NF = 8.06 / 5.17 = 1.56$$

Table 1. 2024 Big Bank Boss Potential Picks [Return](#)

| Type | Symbol | Name | Ranking |
|--------|----------|--|---------|
| Stocks | SMCI | Super Micro Computer - (S&P 500 - 3-18-24) | 1 |

The charts provided show the trending of Year to Date (YTD) Growths. The price fluctuations are entirely random, but a four-year time duration is long enough to show a trend of the highest performing securities. The last column in Tables 2, 3, and 4 are 4-YR Annualized Rate for a apples-to-apples comparison. Cryptocurrency rates are beyond conventional thinking. The Stock Market dragged most securities negative for FY22. Mutual Funds were the least impacted and Cryptocurrencies were the most affected for FY22. Securities rebounded in FY23.

The results in the Table 9 and Table 10 were created with the same algorithm as the other securities. I have included 20 Mutual Funds for my weekly analysis from the list of 100 listed in an article [\(click here\)](#). You should quickly notice that mutual funds are not as volatile as stocks and cryptocurrencies. As of January 5, 2024, the Dow Jones, NASDAQ and S&P 500 saw their largest dip since the beginning of the 2024. On the flip side notice that Now Factor (NF) % is significantly lower for Mutual Funds than Stocks.

Purchase or Not Purchase [Return](#)

Before you decide to purchase, you must assure yourself that you are purchasing a stock that is popular now, services or product is in great demand, beating up on the little guys in the same business, and they set the industry standard in their business area. This company attributes can be confirmed by customer growth, new acquisitions to grow business, increasing quarterly profit and you hear positive news related to their business. It is suggested to make purchases in a dip in the price trend to increase the overall YTD performance.

It is suggested that you make multiple investments in the companies you own throughout the year. This strategy will help you own a better yearly average ownership that will ultimately improve your growth rate of return.

Forget Overvaluation: Wall Street Bulls to Roar in 2024

Nalak Das wrote this article for Yahoo Finance on Monday, March 25, 2024.

Wall Street had a dream run in 2023, reversing the nightmare of 2022. The impressive bull run is set to continue in 2024. The three major stock indexes — the Dow, the S&P 500 and the Nasdaq Composite — have put impressive performances this year. The S&P 500 and the Nasdaq Composite have provided double-digit returns while the Dow is gradually approaching that mark.

A section of economists and financial experts are concerned that valuations of U.S. stocks are overstretched. But, we believe the rally will gather more steam in the rest of this year.

Solid Fundamentals of the U.S. Economy

On Mar 20, after the Federal Open Market Committee (FOMC) meeting, the Fed kept the benchmark lending rate constant in the range of 5.25-5.5%. However, the Fed's latest "dot-plot" (a closely watched matrix of anonymous projections from the 19 officials who comprise the FOMC) shows the benchmark lending rate to come down to 4.625% at mid-point by the end of 2024. The existing mid-point of the Fed fund rate is 5.375%. This indicates three rate cuts of 25 basis points each.

Moreover, the central bank raised the U.S. GDP forecast for 2024 to 2.1% in March from 1.4% in December. U.S. GDP rose 2.5% in 2023 compared with 1.9% in 2022. At the beginning of 2023, the consensus estimate for full-year GDP was 2%. On Mar 19, the Atlanta Fed GDPNow tracker forecast a 2.1% growth rate for first-quarter 2024, indicating, no chance of a near-term recession.

Peak inflation is far behind us. The inflation rate currently hovering around 3.5-3.7%, significantly lower than its peak of 9.1% in June 2022. The labor market remains resilient with increasing wage rate. Moreover, consumer spending, the largest driver of the U.S. economy, remains rock solid.

Impressive Projections

In the past month, several noted economists and financial researchers projected an astonishing outlook for Wall Street's broad-market index — the S&P 500. Barclays raised the S&P 500's target for 2024 to 5,300 from 4,800 owing to the strong earnings of big techs. The firm said that if tech giants continue to outperform in the upcoming quarters, then its bull case for the benchmark will be 6,050.

Yardeni Research forecasted the S&P 500's year end 2024 target at 5,400. Thereafter, the index is expected to rise to 6,000 in 2025 and 6,500 in 2026. Capital Economics predicted that the S&P 500 could reach 6,500 by 2025-end if the ongoing euphoria surrounding artificial intelligence (AI), especially generative AI, continues. Société Générale lifted its 2024 target for the benchmark to 5,500 from 4,750.

Picking the Right Stocks

At this stage, several stocks look attractive for future growth. However, two criteria will make the task easy. First, select U.S. technology bigwigs (market capital > \$50 billion) that have a well-established business model and globally acclaimed brand recognition. Second, look for stocks that have strong growth potential for 2024 and have seen positive earnings estimate revisions in the past 30 days.

The five stocks that fulfill these criteria are: **NVIDIA Corp.** NVDA, **Meta Platforms Inc.** META, **Super Micro Computer Inc.** SMCI, **Micron Technology Inc.** MU and **Synopsys Inc.** SNPS.

Overall comments for the week [Return](#)

The count for trending “Green” for the securities were stocks (26 out of 68), cryptocurrencies (0 out of 14), and mutual funds (5 out of 20).

The Weekly Winners were Robinhood Crypto Exchange (HOOD), Domino’s Pizza (DPZ), Cintas Corp. – Specialty Business (CTAS), Virgin Galactic – Space Travel (SPCE-add), Micro – Semiconductor (MU) with gains of 10%, 8%, 7%, 7%, and 7%, respectively.

The Weekly Losers were Canoo Inc – Electric Automaker (GOEV), AMC Movie Theater (AMC-meme), Facebook – Communication (META), GameStop – Computer Games (GME-meme), and NVIDIA Corp. – Computer Chips (NVDA) with losses of -17%, -9%, -5%, -4%, and -4%, respectively.

I continue to recommend that you do not purchase stocks within days before the quarterly report is posted. It is best to let the market absorb the news good or bad news. If the price drops, you get to purchase the stock at a discount instead of getting hit with an instant -20% loss or greater that will take weeks or months or a year to get back to even.
