

# BIG BANK BOSS NEWSLETTER

Hyperdrive your Investments (Retirement Account) to Enjoy Earlier

This newsletter is supplied to provide you with technical data on movement for some notable Standard and Poor's S&P 500 stocks. I have added some stocks that are relevant for millennials and meme stocks. This newsletter focuses on Technical Analysis (is used more in the review of short-term investments decisions) and no Fundamental Analysis (is most often used when determining the quality of long-term investments).

It has always been said that you should never try to time the Stock Market, but I am here to say you can do it with some level of certainty. You can never achieve 100% certainty in any decision model, but I provide you with an algorithm model with color trends to help you make optimized manual buy and sell decisions. The main purpose of the charts: (1) direct you to make purchases near the Price Curve lows see Buy Range columns "Green" and (2) sell stocks after a triple digit Year to Date (YTD) run up at the presence of trending color change from "Blue" to "Pink".

Below is a typical price curve with the color trends and rebound percentages. This graphical picture should help you visualize the condensed material in the charts. The data generated for stock and mutual funds charts are captured from the closing price on Friday's and crypto currencies data is captured on Friday's at 7 pm.

The chart below is an informative combination of YTD stock movement, and color indicators to show how the price is trending. A stock will trend "Green" after reaching a threshold value for Rebound Factor (RF) % and may trend "Green" for weeks. To minimize purchasing too early in the trending "Green" it is suggested to be patient and wait for the stock to rebound above dip floor before purchased.

Weekly Newsletters	YTD Now-4	YTD Now-3	YTD Now-2	YTD Now-1	YTD Now	Now Price	Buy Low Price	Buy High Price	Trending Green (wks)	Dip Floor Price	Rebound Factor (RF) %	Now Factor (NF) %	Bounce Factor (BF) %

72% or 81% Dip Floor Indicator    
 61% or 19% Wait or Hold Indicator    
 90% Potential Sell Trigger    
 72% or 81% 2nd Dip Floor Indicator

16.34 Now Price is within the Buy Now Price Range    
 -13% Now Low-Price Indicator    
 -13% 2nd Low-Price Indicator    
 N/A No Suggested Buy In Price due to Max Potential < 44%    
 XX% Rebound % back to recent high price

Notice that as the price gets closer to the bottom of the dip, the YTD N color repeats being “Yellow” until the bottom is reached, and a “White” font appears YTD N-1 to signify the Now Price is on an upswing. I do not tell you when to buy or sell, but I provide you a Potential Sell Trigger so you can make an informed choice amid an unknown future.

The Legion Chart on the previous page should be the most informative tool an active trader has ever had. The condensed format of taking stock curve price data and converting it into YTD Analysis should be a real breakthrough. This process suggests making stock market decisions before the stock market opens and removes the need to monitor the stock market during the day. Remember we are supposed to be working our 9 to 5 job while the stock market is doing its thing growing our investment dollars. Yes, I am providing this useful information tool for free. Below is the explanation of all the columns from left to right.

1. YTD N-2 - this is the Year-to-Date growth of a stock two weeks in the past.
2. YTD N-1 - this is the Year-to-Date growth of a stock one week in the past.
3. YTD N - this is the Year-to-Date growth of a stock right now the week of the published Newsletter.
4. Now Price - is the now price of the stock the week of the published Newsletter.
5. Buy Low Price - this is a fixed price above the Dip Floor Price to allow for price float and minimize false buy triggers. When the Stock Price is above the Buy Low Price and below the Buy High Price, both cells will be “Green” to signify it is a good time to consider making a purchase. You can enter either Low or High Price in your brokerage account as a limit order.
6. Buy High Price - this is a fixed price above the Dip Floor Price to allow for price float above the Buy Low Price. The float provided is a default for all stocks, but the float is increased for stocks that have a Spike Ratio of 2.0. When the Stock Price is above the Buy Low Price and below the Buy High Price. These cells will be “Green” to signify it is a good time to consider making a purchase. You can enter this cell value in your brokerage account for a limit order.
7. Trending Green (wks) - This provides you with the number of weeks a particular stock has been between the Buy Price ranges. The float provided is a default for all stocks, but the float is increased for stocks that have a Spike Ratio of 2.0. This small Buy Now range could be jumped over because of the data being measured is once every 7-days. Yes, the cell could have N/A in it and not catch anything. This active trader tool is suggestive and is not intended to be an absolute tool. For this reason, you should consider entering the Buy High or Low Price as a Limit Orders in your Brokerage Account.
8. Spike Ratio – this is an indicator of stocks with a hyperbolic gain that typically has an associate quick drop off. If you own a stock that grows to a Spike Ratio of 2, I suggest you sell near the high and take your quick gain. I would suggest that you not purchase the dip of a stock with a Spike Ratio of 2 because a repeat growth back to the previous high is not based on performance but popularity and speculation.
9. Dip Floor Price - the price provided will be one of two prices. One is the lowest price in the range of measured prices. The second is a dip price below the 52-Week High. The second dip price is typically something that can't be measured or suggested by traditional trading tools.
10. Rebound Factor (RF) % - this is exactly what you think it is. This is the ratio of maximum past (June of previous year) to present price divided by the measured range divided by the lowest past (December 31st of previous year) to present price which is called the RF. The RF is then converted to a percentage. This value is always positive.
11. Now Factor (NF) % - This is the positive replacement for the 52-Week Change%. Who cares how much the price has dropped from the high price. This is the wrong thing to measure. This is the ratio of maximum past (June of previous year) to present price divided by the Now Stock Price which is called the NF. The NF is then converted to a percentage. The real thing to measure is the growing Exponential Rebound as the price drops further and further. If a stock has a 52-Week Change% of -50% or -75%, the corresponding Now Potential Rebound 100% or 300%, respectively. You say to yourself, WOW. The Now Potential Rebound of 100% or 300% would be a multiple of 2 or 4, respectively. If you invested \$32,000 and achieved a multiple of 2 or 4 your investment dollars would be \$64,000 or 128,000, respectively. The growth of the security has a 1 to 1 relationship with total investment made in a company.
12. Bounce Factor (BF) % - the percentage provided can be “Zero” for two situations. One is when price is at the absolute lowest price for the price range. The second is when price sets lower or a new lower price. The default calculated percentage when not “Zero” is the ratio of the Now Stock Price divided by Dip Floor Price which is called the BF. The BF is then converted to a percentage.

## Big Bank Boss Triple Point Reference Frame

The discrete measurements of 52-Week High Change % and 52-Week Low Change % are at best an apples and oranges comparison and not entirely useful. For this exact reason, I created the Big Bank Boss Triple equations. The Big Bank Boss Triple equations output are positive numbers. The ratios can easily be converted to percentages. Now you have an apple-to-apple comparison with real-time growth potential. The output results define the now stock price in a triple reference box of the Rebound Factor (RF), Now Factor (NF) and Bounce Factor (BF).

These formulas are very useful whenever the Stock Market goes thru a crisis or market correction. The Bounce Factor (BF) is identical to the 52-Week Low Change which represents the percentage above the Dip Floor Price. The Rebound Factor (RF) defines the maximum potential range for a stock based on past performance. The values of NF and BF in themselves do not provide a holistic picture. It is very important to add in the crucial component of trending upward or downward. If the trend of the price is downward the NF increases and the BF decreases.

There is no way to predict when future stock prices will trend upward, but I provide a weekly Big Bank Boss Newsletter that shows the weekly price trend charts with a “Yellow” cell to indicate a new low indicator and a “White” font cell to indicate a trending up from the Dip Floor Price.

**H** 5.24 Figure 1. Big Bank Boss Triple Point for RIG as of Jan. 29, 2021

## Big Bank Boss Triple Point Equations

These three equations are always positive and make it easy to convert to percentages. Also, a unique thing about these ratios is an equation can be formed to solve for one unknown. This equation can be the building block for a program to monitor stock price movement. The 52-Week Range for RIG is converted below.

$$\text{Rebound Factor (RF)} = (52 - \text{Week High}) / (52 - \text{Week Low})$$

$$= (5.24 / 0.65) = 8.06$$

$$(\text{RF}) \% = ((\text{RF}) - 1) \times 100$$

$$= ((8.06) - 1) \times 100 = 706\%$$

$$\text{Now Factor (NF)} = (52 - \text{Week High}) / (\text{Now Price})$$

$$= (5.24 / 3.36) = 1.56$$

$$(\text{NF}) \% = ((\text{NF}) - 1) \times 100$$

$$= ((1.56) - 1) \times 100 = 56\%$$

$$\text{Bounce Factor (BF)} = (\text{Now Price}) / (52 - \text{Week Low})$$

$$= (3.36 / 0.65) = 5.17$$

$$(\text{BF}) \% = ((\text{BF}) - 1) \times 100$$

$$= ((5.17) - 1) \times 100 = 417\%$$

The three Big Bank Boss Triple Point equations are linked in the single equation shown below. This equation only works for values are ratios, so you can't use this formula when the values are percentages.

$$NF = RF / BF$$

Substitution:

$$RF = 8.06 \text{ and } BF = 5.17$$

$$NF = 8.06 / 5.17 = 1.56$$

How to interpret the bar chart and the tables to build a knowledgeable purchasing decision:

1. This trending bar chart informs the investor of the Top 5 highest ranking from left to right growth securities each week. The names will change for the first couple of weeks, but the names should stabilize. No picks should be made with this bar chart alone.

**Table 1. Actual Bubble Up Stock Trends after 6 weeks**

2. The below table provides the benchmark securities with the highest average growth rate over several years. These are the stocks you should consider as security picks from the trending bar chart. This below table shows you the volatility of growth rates from year to year. This is provided to help shape your expectations of future growth rates. All active investors have to live with the up and down growth rates from year to year, but the sum of it all is a positive cumulative growth rate.

**Table 2. Ranking Performances from 2025 – 2020 (as of 1/2/26)**

**Symbols in italics are the Titan Ten Stocks**

3. Now that you have a wholistic basis for your securities pick, you can now purchase your security when the trending now indicator is "Green". The trending "Green" indicator is active at growth rates up to ~ 30% Growth Rate YTD, so if you want to purchase a security later in the growth curve that is entirely up to you. This Bubble Up Trending "Green" table is entire driven by the stock market saying, "Buy Low and Sell High." All of the charts are provided to give the active investor real-time indicators to make stock market potential decision.

How to work the three data sets to build a knowledgeable purchasing decision:

1. This trending bar chart informs the investor of the Top 5 highest ranking from left to right growth securities each week. The names will change for the first couple of weeks, but the names should stabilize. No picks should be made with this bar chart alone.

**Table 5. Actual Bubble Up Crypto Trends after 6 weeks**

2. The below table provides the benchmark securities with the highest average growth rate over several years. These are the stocks you should consider as security picks from the trending bar chart. This below table shows you the volatility of growth rates from year to year. This is provided to help shape your expectations of future growth rates. All active investors have to live with the up and down growth rates from year to year, but the sum of it all is a positive cumulative growth rate.

**Table 6. Ranking Performances from 2025 – 2020 (as of 1/2/26)**

3. Now that you have a wholistic basis for your securities pick, you can now purchase your security when the trending now indicator is "Green". The trending "Green" indicator is active at growth rates up to ~ 30% Growth Rate YTD, so if you want to purchase a security later in the growth curve that is entirely up to you. This Bubble Up Trending "Green" table is entire driven by the stock market saying, "Buy Low and Sell High." All of the charts are provided to give the active investor real-time indicators to make stock market potential decision.

How to work the three data sets to build a knowledgeable purchasing decision:

1. This trending bar chart informs the investor of the Top 5 highest ranking from left to right growth securities each week. The names will change for the first couple of weeks, but the names should stabilize. No picks should be made with this bar chart alone.

**Table 9. Actual Bubble Up Mutual Funds Trends after 6 weeks**

2. The below table provides the benchmark securities with the highest average growth rate over several years. These are the stocks you should consider as security picks from the trending bar chart. This below table shows you the volatility of growth rates from year to year. This is provided to help shape your expectations of future growth rates. All active investors have to live with the up and down growth rates from year to year, but the sum of it all is a positive cumulative growth rate.

**Table 10. Ranking Performance from 2025 – 2020 (as of 1/2/26)**

3. Now that you have a wholistic basis for your securities pick, you can now purchase your security when the trending now indicator is "Green". The trending "Green" indicator is active at growth rates up to ~ 30% Growth Rate YTD, so if you want to purchase a security later in the growth curve that is entirely up to you. This Bubble Up Trending "Green" table is entire driven by the stock market saying, "Buy Low and Sell High." All of the charts are provided to give the active investor real-time indicators to make stock market potential decision.

The explanation provided in the previous section was redundant on purpose. Active traders may have preference of one security over another, so I provide the same introduction for all of the securities. The legend and the layout of the table are the same to make it easier for the reader.

## **Bitcoin price falls below pre-Trump second term levels, now hovering below \$67,000**

This article was written by the Associated Press on Thursday, February 5, 2026.

The price of bitcoin continued its monthslong slide Thursday, falling another 11% to \$67,000, and is now worth less than it was when President Donald Trump was elected to his second term of office.

The original cryptocurrency, pitched as “digital gold,” has lost nearly half of its value since Oct. 6, when it hit a record high of \$126,210.50, according to crypto trading platform Coinbase. As of 2 p.m. ET, the currency was trading at \$66,301.

After the election of Trump in November of 2024, Bitcoin prices chugged higher for the better part of a year, in part due to investors’ expectations of a more crypto-friendly administration in Washington. But those gains have now been erased.

The sell-off appears to be a combination of investors pulling out of speculative assets like gold, silver and digital currencies, as well as a concern about the future of cryptocurrency regulation in Washington, despite Trump heavily backing cryptocurrency companies since his election.

The cryptocurrency industry wants to be able to pay customers for holding their deposits in crypto or stablecoins, a move that the banking industry would absolutely oppose. Banks believe cryptocurrency accounts providing a dividend or yield would take money out of the traditional banking system. Presently it appears the bill is not going to move forward in Congress.

One popular way of investing in bitcoin is through spot bitcoin ETFs, or exchange-traded funds, which allow investors to have a stake in bitcoin without directly owning the cryptocurrency. According to data from Morningstar Direct, investors pulled about \$5.7 billion out of spot bitcoin ETFs from November through January.

Companies that enable investors to buy and sell cryptocurrencies, as well as the growing number of companies who have made investing in bitcoin their main business focus, have also been hit hard in the recent sell-off. Coinbase Global fell 9.1% and online trading platform Robinhood Markets lost 8.1%. Bitcoin mining company Riot Platforms dropped 10%.

Strategy, the biggest of the so-called crypto treasury companies that raise money just to buy bitcoin, tumbled 13%. The company, formerly called MicroStrategy, reports on its website holdings of 713,502 bitcoin. With the average purchase price for those above \$76,000, it means the company is under water on the investment. Thursday morning its bitcoin holdings were worth about \$47.8 billion, less than the \$54.3 billion Strategy says they cost.

American Bitcoin, in which Trump’s sons Eric Trump and Donald Trump Jr. hold a stake, fell 6.6% and is now down more than 80% since Oct. 7.

Other Trump-related crypto ventures have declined as well. The market value for the World Liberty Financial token, or \$WLFI, has fallen to about \$3.25 billion from above \$6 billion in mid-September, according to coinmarketcap.com. And the price of a meme coin named for President Trump, \$TRUMP, is \$3.93, a fraction of the \$45 asking price just before his inauguration in January.

Read the entire article in Associated Press: <https://stocks.apple.com/AWrwWYRnyRlYojFxcqkWPiQ>

The count for trending “Green” for the securities were stocks (20 out of 63), cryptocurrencies (0 out of 14), and mutual funds (0 out of 20).

The Weekly Winners were Supermicro – Hardware, Storage (SMCI), Arm Holdings – Physical IP (ARM), United Airlines – Passenger Airlines (UAL), Celestica – Hardware and Software (CLS), and Koss Inc. – Electronic Retailers (KOSS) with gains of 18%, 17%, 13%, 9%, and 8%, respectively.

The Weekly Losers were Snapchat – Communications (SNAP), PayPal – Payment Processing (PYPL), HubSpot – Online Software Sales (HUBS), Robinhood – Crypto Exchange (Hood), and Coinbase – Crypto Exchange (COIN) with losses of -25%, -23%, -17%, -17% and -15%, respectively.

I continue to recommend that you do not purchase stocks within days before the quarterly report is posted. It is best to let the market absorb the news good or bad news. If the price drops, you get to purchase the stock at a discount instead of getting hit with an instant -20% loss or greater that will take weeks or months or a year to get back to even.
